first value or a second value in response to detecting that the mobile station is entering or leaving soft handoff; and wherein the transceiver subsystem is further configured to transmit data on a reverse link of the wireless link in accordance with the frame size".

Applicant's independent claim 10 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 15: The present in invention is directed to a mobile station configured to operate in a wireless communication system, the independent claim identifies the patentably distinct feature "wherein the processing subsystem is configured to set a transmission parameter of the wireless link for the transceiver subsystem in response to detecting that the mobile station is entering or leaving soft handoff, to detect that the mobile station is entering or leaving soft handoff based upon a received handoff direction message (HDM), to set the transmission parameter to a first value if the HDM directs the mobile station to enter soft handoff, and to set the transmission parameter to a second value if the HDM directs the mobile station to leave soft handoff, wherein the transmission parameter comprises a frame size defining a time over which a frame of data is transmitted, and wherein the first value is greater than the second value". Applicant's independent claim 15 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 18: The present in invention is directed to method implemented in a wireless communication system, the independent claim identifies the patentably distinct feature "detecting a mobile station communicating via a wireless link entering or leaving soft hand off; and modifying a transmission parameter of the

wireless link for the mobile station in response to detecting the mobile station entering or leaving soft handoff; wherein the transmission parameter comprises a frame size defining a time over which a frame of data is transmitted, wherein if the mobile station is detected entering soft handoff, the frame size is set to a first size and wherein if the mobile station is detected leaving soft handoff, the frame size is set to a second size".

Applicant's independent claim 18 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 21: The present in invention is directed to a method implement in a wireless communication system, the independent claim identifies the patentably distinct feature "detecting a mobile station entering or leaving soft handoff; and modifying a transmission parameter for the mobile station in response to detecting the mobile station entering or leaving soft handoff, wherein the transmission parameter comprises a frame size, wherein if the mobile station is detected entering soft handoff, the frame size is set to a first size and wherein if the mobile station is detected leaving soft handoff, the frame size is set to a second size, wherein the first size is greater than the first size, and wherein the first size is 10 ms and the second size is 2 ms". Applicant's independent claim 21 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 27: The present in invention is directed to a method implemented in a mobile station, the independent claim identifies the patentably distinct feature "detecting that the mobile station is entering or leaving soft handoff; if the mobile station is entering soft handoff, setting a transmission parameter of the

wireless link to a first value; and if the mobile station is leaving soft handoff, setting the transmission parameter of the wireless link to a second value; wherein the transmission parameter comprises frame size defining a time over which a frame of data is transmitted". Applicant's independent claim 27 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 33: The present in invention is directed to a method implemented in a mobile station, the independent claim identifies the patentably distinct feature "detecting that the mobile station is entering or leaving soft handoff; if the mobile station is entering soft handoff, setting a transmission parameter to a first value; and if the mobile station is leaving soft handoff, setting the transmission parameter to a second value, wherein the transmission parameter comprises a frame size, wherein the first value is greater than the second value, and wherein the first value is 10 ms and the second value is 2 ms". Applicant's independent claim 33 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 34: The present in invention is directed to a method and apparatus implemented in a wireless communication system, the independent claim identifies the patentably distinct feature "means for detecting that a mobile station communicating via a wireless link is entering or leaving soft handoff; means for setting a transmission parameter of the wireless link to a first value if the mobile station is entering soft handoff; and means for setting the transmission parameter of the wireless link to a second value if the mobile station is leaving soft handoff, the transmission parameter comprising a frame size defining a time over which

a frame of data is transmitted". Applicant's independent claim 34 comprises a particular combination of elements, which is neither taught nor-suggested by prior art.

Applicant's independent claim 39: The present in invention is directed to an apparatus for wireless communication, the independent claim identifies the patentably distinct feature "means for detecting that a mobile station is entering or leaving soft handoff; means for setting a transmission parameter to a first value if the mobile station is entering soft handoff; and means for setting the transmission parameter to a second value if the mobile station is leaving soft handoff, the transmission parameter comprising a frame size, wherein the first value is 10 ms than the second value is 2 ms".
